PROFESSIONAL SUMMARY

Cleared technical professional with 6+ years of experience supporting mission-critical defense systems in operational, production, and depot-level environments. Hands-on background with Red Hat / CentOS Linux, secure hardware, system-level diagnostics, hardware/software integration, fault isolation, and root cause analysis. Transitioning toward systems administration, network engineering, and cloud infrastructure roles with a strong troubleshooting mindset and experience in security-conscious, high-availability environments.

TECHNICAL SKILLS

- **Operating Systems:** Linux (Red Hat / CentOS); Linux-based test workflows
- **Documentation & Standards:** Schematics; interface control documents (ICDs); technical manuals; maintenance procedures; PFS; GCSS-Army; NAVSEA compliance; ESD and laser safety
- **Systems & Infrastructure:** System-level diagnostics; hardware/software integration; fault isolation; root cause analysis; secure HSM testing; embedded and control systems; test execution and performance data analysis
- **Security / Environment:** Active Secret Clearance; secure hardware handling; production and depot-level support; high-reliability environments

PROFESSIONAL EXPERIENCE

ELECTRICAL ENGINEERING TECHNICIAN | 09/2025 to Current

The Amatriot Group - Crane, IN

- Support depot-level test, repair, and validation of U.S. Navy electro-optical (EO/IR) airborne sensor systems across complex electronic and software-integrated assemblies.
- Execute system-level testing, analyze performance data, and isolate faults, anomalies, and system deviations to restore full system functionality.
- Use Linux-based test workflows plus schematics, ICDs, and maintenance procedures to guide troubleshooting, repair, and validation.
- Partner with engineering teams on root cause analysis, corrective actions, documentation updates, and process improvements that increase reliability and maintainability.
- Maintain compliance with NAVSEA requirements including ESD control, laser safety, and hazardous material procedures.

TEST OPERATOR II | 05/2025 to 09/2025

Benchmark Electronics - Huntsville, AL

- Executed Linux-based scripts to functionally test and personalize secure Hardware Security Modules (HSMs) in a high-output production environment.
- Validated and processed 500+ serialized HSM units representing approximately \$500K-\$1M+ in hardware while maintaining functionality, compliance, encryption integrity, and traceability.
- Troubleshoot failed units, documented pass/fail results in PFS, and coordinated with engineering on root cause analysis and yield improvement.

PATRIOT SYSTEM MAINTAINER | 01/2021 to 05/2024

U.S. Army - Okinawa, Japan

- Diagnosed and maintained PATRIOT Radar, ECS, AMG, BCP, and Launching Station subsystems, using Red Hat-based systems and technical manuals to isolate faults across integrated radar and control systems.
- Repaired and replaced more than \$1M in mission-critical hardware while maintaining 95% system uptime and supporting live-fire readiness.
- Implemented a repair optimization that reduced equipment costs by \$25,000.
- Logged maintenance and system data in GCSS-Army to support operational tracking, maintenance history, and readiness.
